

Minelco FordaCal

Category : Ceramic

Material Notes:

The Fordacal product range is in the form of marble. The mineralogical nature of Fordacal marble powders coupled with a granular particle shape and carefully controlled particle size distribution make it ideal for a variety of applications. The major advantages of Fordacal is excellent color consistency and high brightness. Applications: Very fine grades equivalent to precipitated CaCO₃ are used in a number of sealant applications to modify rheology and in surface coatings to extend the pigment blend without affecting gloss levels. Fine to medium particle size ground grades are used in a variety of applications where color is paramount including oral hygiene products, household products and decorative coating applications in paints and sealants. Cut grades are manufactured to have a specific particle size distribution with low fines which can contribute to high viscosity. These products are used widely in applications where process viscosity is a factor such as PVC plastisols.
